

How to update from version 1.9.5 or 1.9.6 to version 1.9.7?

Requirements:

Rocket LMS 1.9.5 or 1.9.6 installed on your host

PHP 8.1 activated on the host

MariaDB +10.2 or MySQL +5.7

How to update:

We created a video tutorial to update your platform. You can find it in the “Update” folder inside the package you downloaded from Codecanyon or CRM.

Important Notes:

1- Make sure to backup your files and the database before the update process. When you follow the update video tutorial, you will make a backup from your files.

For database backup please go to the “phpmyadmin” on your host, select the database and navigate to the “Export” tab and export the database. ([How to?](#))

2- If you want to install Rocket LMS from scratch, there is no need to update your platform. You can directly install Rocket LMS v1.9.7.

3- You will be asked for license activation after installation for Rocket LMS and the plugin bundle. You can download the license files you already got for v1.8 or v1.9 from CRM and use them.

4- You might face “Paid Plugin” state on some pages after the update. If you purchased the plugin bundle, you need to download the plugin bundle (v1.9.7) from Codecanyon and install it.

You can contact us in CRM and get the full package. This package includes Rocket LMS and all plugins so there is no need to install plugins separately. Getting this package requires having an active support plan for Rocket LMS and valid licenses for Rocket LMS and the plugin bundle.
